IN THE CLAIMS

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

(Currently amended) A method of processing communication packets comprising:
assigning a first communication packet to a first communication data structure
which is unique to a first connection that comprises said first communication
packet;

selecting a first event list from a database, said first event list selected based on a classification of said first communication packet, said first event list identifying a first plurality of communication modules specific for said first connection and an ordering thereof, each communication module of the first plurality of communication modules in the first event list configured to manipulate the corresponding communication module portion of the first event list so that subsequent packets can use the manipulated one or more of the first plurality of communication modules in first event list for processing;

processing said first communication packet through said first plurality of communication modules based on said ordering of said first event list; and manipulating said first event list to enable a communication module of said first plurality of communication modules to enter one of a plurality of operational states associated with said communication module.

Reply to Office action of June 27, 2007

- 2. (Original) A method as described in claim 1 wherein said manipulating said first event list enables said communication module to move through each of said plurality of operational states.
- 3. (Original) A method as described in claim 2 wherein said plurality of operational states has an order.
- 4. (Original) A method as described in claim 1 further comprising classifying said first communication packet to determine which communication modules are required for processing thereof, said classifying performed before said selecting.
- 5. (Original) A method as described in claim 1 wherein said first communication packet is an initial communication packet of a plurality of communication packets of said first connection.
- 6. (Original) A method as described in claim 5 further comprising:

accessing a second communication packet of said first connection;

accessing said first communication data structure to identify said first event list associated with said first connection; and

processing said second communication packet through said plurality of communication modules based on said ordering.

7. (Original) A method as described in claim 6 wherein said communication modules comprise function call interfaces.

- 8. (Original) A method as described in claim 6 wherein said communication packets are send or receive communication packets.
- 9. (Original) A method as described in claim 1 wherein said first data structure comprises a first pointer to the first communication module of said first event list and a second pointer which points to the currently processed communication module during said processing of said first event list.
- 10. (Currently amended) A method as described in claim 1 further comprising:

assigning a third communication packet to a second communication data structure that is unique to a second connection that comprises said third communication packet;

selecting a second event list from said database, said second event list selected based on a classification of said third communication packet, said second event list identifying a second plurality of communication modules specific for said second connection and an ordering thereof, each communication module of the second plurality of communication modules in the second event list configured to manipulate the corresponding communication module portion of the second event list so that subsequent packets can use the manipulated one or more of the second plurality of communication modules in second event list for processing, wherein said first plurality of communication modules; [[and]]

processing said third communication packet through said second plurality of communication modules based on said ordering of said second event list; and

PATENT

manipulating said second event list to enable a communication module of said second plurality of communication modules to enter one of a plurality of operational states associated with said communication module.

- 11. (Original) A method as described in claim 10 wherein said third communication packet is an initial communication packet of a plurality of communication packets of said second connection.
- 12. (Original) A method as described in claim 10 further comprising:

accessing said fourth communication packet associated with said second connection;

accessing said second communication data structure to identify said second event list associated with said second connection; and

processing said fourth communication packet through said second plurality of communication modules based on said ordering of said second event list.

- 13. (Original) A method as described in claim 10 wherein said second data structure comprises a first pointer to the first communication module of said second event list and a second pointer which points to the currently processed communication module during said processing of said second event list.
- 14. (Original) A method as described in claim 10 further comprising classifying said third communication packet to determine which communication modules are required for processing thereof, said classifying of said third communication packet performed before said selecting of said second event list.

- 15. (Original) A method as described in claim 10 wherein said communication modules comprise function call interfaces.
- 16. (Currently amended) A method of processing communication packets within a communication framework comprising a first plurality of modules, said method comprising:

assigning a first communication packet to a first communication data structure which is unique to a first connection that comprises said first communication packet;

selecting a first event list from a database, said first event list selected based on a classification of said first communication packet, said first event list identifying a second plurality of modules specific for said first connection and an ordering thereof, each module of the second plurality of modules in the first event list configured to manipulate the corresponding module portion of the first event list so that subsequent packets can use the manipulated one or more of the second plurality of modules in the first event list for processing, wherein said second plurality is a subset of said first plurality;

processing said first communication packet through said second plurality of modules based on said ordering of said first event list; and

changing said first event list to enable a module of said second plurality of modules to enter one of a plurality of operational states associated with said module.

17. (Original) A method as described in claim 16 wherein said changing said first event list enables said module to pass through each of said plurality of operational states.

PATENT

Reply to Office action of June 27, 2007

- 18. (Original) A method as described in claim 17 wherein said plurality of operational states has an operational order.
- 19. (Original) A method as described in claim. 16 further comprising classifying said first communication packet to determine which modules are required for processing thereof, said classifying performed before said selecting.
- 20. (Original) A method as described in claim 16 wherein said first communication packet is an initial communication packet of a plurality of communication packets of said first connection and further comprising:

accessing a second communication packet of said first connection; accessing said first communication data structure to identify said first event list associated with said first connection; and

processing said second communication packet through said second plurality of modules based on said ordering.

- 21. (Original) A method as described in claim 16 wherein said first data structure comprises a first pointer to the first module of said first event list and a second pointer which points to the currently processed module during said processing of said first event list.
- 22. (Currently amended) A method as described in claim 16 further comprising: assigning an third communication packet to a second communication data structure that is unique to a second connection that comprises said third communication packet;

selecting a second event list from said database, said second event list selected based on a classification of said third communication packet, said second event list identifying a third plurality of modules specific for said second connection and an ordering thereof, each communication module of the third plurality of modules in the second event list configured to manipulate the corresponding communication module portion of the second event list so that subsequent packets can use the manipulated one or more of the third plurality of communication modules in second event list for processing, wherein said third plurality is a subset of said first plurality and wherein further said second plurality is different from said third plurality;

processing said third communication packet through said third plurality of modules based on said ordering of said second event list; and

manipulating said second event list to enable a module of said third plurality of modules to enter one of a plurality of operational states associated with said module.

23. (Original) A method as described in claim 22 wherein said third communication packet is an initial communication packet of a plurality of communication packets of said second connection and further comprising:

accessing a fourth communication packet associated with said second connection;

accessing said second communication data structure to identify said second event list associated with said second connection; and

processing said fourth communication packet through said third plurality of modules based on said ordering of said second event list.

- 24. (Original) A method as described in claim 22 wherein said second data structure comprises a first pointer to the first communication module of said second event list and a second pointer which points to the currently processed module during said processing of said second event list.
- 25. (Original) A method as described in claim 22 further comprising classifying said third communication packet to determine which modules are required for processing thereof, said classifying of said third communication packet performed before said selecting of said second event list.
- 26. (Currently amended) A communication system comprising:
 - a) a first plurality of communication modules for processing communication packets, each communication module of the first plurality of communication modules configured to manipulate the corresponding communication module portion so that subsequent packets can use the manipulated one or more of the first plurality of communication modules for processing;
 - b) a database comprising:
 - a first event list indicating a second plurality of communication modules for processing communication packets and an ordering thereof and wherein said second plurality is a subset of said first plurality,
 - a communication module of said second plurality of communication modules for modifying said first event list; and a second event list indicating a third plurality of communication modules for processing communication packets and an ordering thereof and wherein said third plurality is a subset of said first plurality and is different from said second plurality,

Appl. No. 10,683,959 Amdt. dated September 24, 2007 Reply to Office action of June 27, 2007

a communication module of said third plurality of communication modules for modifying said second event list; and

- c) a classifier for classifying respective communication packets and based thereon for assigning respective communication packets to one of said first and second event lists for processing thereof and wherein communication packets of a common communication connection are processed through the same event list.
- 27. (Original) A communication system as described in claim 26 wherein said communication module of said second plurality of communication modules for modifying said first event list to enter one of a plurality of operational states associated with said communication module of said second plurality of communication modules.
- 28. (Original) A communication system as described in claim 27 wherein said communication module of said third plurality of communication modules for modifying said second event list to enter one of a plurality of operational states associated with said communication module of said third plurality of communication modules.
- 29. (Original) A communication system as described in claim 27 wherein said communication module of said second plurality of communication modules for modifying said first event list to move through each of said plurality of operational states.

Reply to Office action of June 27, 2007

- 30. (Original) A communication system as described in claim 29 wherein said plurality of operational states has an order.
- 31. (Original) A communication system as described in claim 26 further comprising a plurality of data structures, each data structure associated with a respective communication connection and indicating an event list to be used for processing communication packets of said respective communication connection.
- 32. (Original) A communication system as described in claim 26 wherein said communication modules are function call modules.
- 33. (Original) A communication system as described in claim 26 wherein said communication packets are send communication packets.
- 34. (Original) A communication system as described in claim 26 wherein said communication packets are receive communication packets.
